

GeoSpectrum has completed the design and development of the M2E, an exportable version of the M2. The M2E incorporates a switch that shorts out the hydrophone before reaching a depth of 35m, making it compliant with US state Department export regulations for sales to restricted countries. Geospectrum recently shipped the first lot of M2E hydrophones to a customer in the US, who will be testing them at sea.

The M2E is an alternative to the Benthos produced GeoExport®, their switched version of the Geopoint® hydrophone.
